Two-state closure: smeared vs fixed observable comparison
(a) Potential, $V_0 = 0.03$ (thick=envelope)
Smeared obs. [CONVERGED]
Fixed obs. [NOT CONV]
Φ/c_*^2
r/a
(b) Lapse, $V_0 = 0.03$
Smeared obs.
Fixed obs.
$N = 1 + \Phi/c_*^2$
r/a
(c) Envelope 1/r test: $-\Phi_{\rm env} r$ vs r
Smeared env (GM=0.01087)
Fixed env (GM=0.00011)
$-\Phi_{\rm env} \cdot r$
r/a
(d) r_s and min lapse vs V_0
r_s smeared (env)
r_s fixed (env)
min(N) smeared
min(N) fixed
r_s/a (from envelope)
min(N)
V_0
